

**New host records of the root-knot nematode, *Meloidogyne incognita* (Kofoid & White)
Chitwood**

P.C. TRIVEDI, C. SHARMA and S. DATTA

Department of Botany, University of Rajasthan, Jaipur-302 004

During survey of plant parasitic nematodes in Jaipur district some following new hosts for root-knot nematode, *Meloidogyne incognita* were found.

New records : *Erantoemum nervosum*

Roxb. (D); *Sesbania sesban* (Linn.)
Merr. (B.)

New reports from India : *Euphorbia
tirucalli* L. (C) : *Polycarpia
corymbosa* (Linn.) Lamé (A).

Occurrence of *Radopholus similis* on betel vine (*Piper betle* L.) in Karanataka

P. SUNDARARAJU and C.P. SUJA

Section of Nematology, Central Plantation Crops Research Institute, Kasaragod-670 124, Kerala

During a survey (1982-84), betelvine plants, intensively grown in arecanut garden in Karnata State, showed symptoms of wilting and yellowing of leaves. When the unhealthy plants were uprooted, moderate to severe lesions and rotting were observed on the roots. Nematode population from roots and soil showed presence of *Radopholus similis*, which is quite common in Chickmagalur district. The population varied from 5 to 200 per

gram of root. This is the first record of occurrence of *R. similis* on betelvine from Karnataka State. The presence of this nematode on betelvine will pose serious problem to plantation crops which required immediate control measures to check further spread in the area.

Authors are thankful to Dr K.V. Ahmed Bavappa, Director, C.P.C.R.I., Kasaragod for providing necessary facilities.
